This invention relates to compounds having pharmacological activity, processes for their preparation, to compositions containing them and to their use in the treatment of CNS disorders.

Compounds having 5HT<sub>2C</sub> receptor antagonist activity are known in the art. For example PCT/EP96/00368 discloses indoline derivatives as 5HT<sub>2C</sub> antagonists.

However certain 5HT<sub>2C</sub> receptor antagonists exhibit poor solubility which may lead to decreased activity. It has now been found that pyridinium derivatives of certain known 5HT<sub>2C</sub> receptor antagonists show increased solublility and increased *in vivo* activity. It is believed that these new compounds are converted to their 'parent' compounds prior/during/or after absorption and so may increase the bioavailability of the 'parent' compound. The compounds of the invention may therefore act as prodrugs and are defined as prodrugs herein.

The present invention therefore provides, in a first aspect, a prodrug of a 5HT<sub>2C</sub> receptor antagonist wherein the prodrug has a quaternary ammonium group, in particular a quaternary pyridinium group.

Preferably the invention provides a compound of formula (I):

$$(R^{1})_{n} \xrightarrow{P^{1}} A \xrightarrow{P^{2}} \stackrel{R^{3}}{\underset{R^{4}}{\bigvee}} O$$

Compounds of formula (I) and their pharmaceutically acceptable salts have 5HT<sub>2B/2C</sub> receptor antagonist activity and are believed to be of potential use for the treatment or prophylaxis of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS as well as microvascular diseases such as macular oedema and retinopathy.

Thus the invention also provides a compound of formula (I) for use as a therapeutic substance, in particular in the treatment or prophylaxis of the above disorders.

The invention further provides a method of treatment or prophylaxis of the above disorders, in mammals including humans, which comprises administering to the sufferer a therapeutically effective amount of a compound of formula (I).

In another aspect, the invention provides the use of a compound of formula (I) in the manufacture of a medicament for the treatment or prophylaxis of the above disorders.

The present invention also provides a pharmaceutical composition, which comprises a compound of formula (I) and a pharmaceutically acceptable carrier.

A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form

10

15

20

25

30

of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusable solutions or suspensions or suppositories. Orally administrable compositions are generally preferred.

Tablets and capsules for oral administration may be in unit dose form, and may contain conventional excipients, such as binding agents, fillers, tabletting lubricants, disintegrants and acceptable wetting agents. The tablets may be coated according to methods well known in normal pharmaceutical practice.

Oral liquid preparations may be in the form of, for example, aqueous or oily suspension, solutions, emulsions, syrups or elixirs, or may be in the form of a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), preservatives, and, if desired, conventional flavourings or colourants.

For parenteral administration, fluid unit dosage forms are prepared utilising a compound of the invention or pharmaceutically acceptable salt thereof and a sterile vehicle. The compound, depending on the vehicle and concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions, the compound can be dissolved for injection and filter sterilised before filling into a suitable vial or ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, preservatives and buffering agents are dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is suspended in the vehicle instead of being dissolved, and sterilization cannot be accomplished by filtration. The compound can be sterilised by exposure to ethylene oxide before suspension in a sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

The composition may contain from 0.1% to 99% by weight, preferably from 10 to 60% by weight, of the active material, depending on the method of administration.

The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight

WO 97/37989 PCT/EP97/01611

of the sufferer, and other similar factors. However, as a general guide suitable unit doses may be 0.05 to 1000 mg, more suitably 0.05 to 20.0 mg, for example 0.2 to 5 mg; and such unit doses may be administered more than once a day, for example two or three a day, so that the total daily dosage is in the range of about 0.5 to 100 mg; and such therapy may extend for a number of weeks or months.

When administered in accordance with the invention, no unacceptable toxicological effects are expected with the compounds of the invention.

The following Descriptions and Examples illustrate the preparation of compounds of the invention.

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This Inu	ernational Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. 🗆	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
1 —	Claims Nos.: because they relate to parts of the international Application that do not comply with the prescribed requirements to such an extent that no meaningful international Search can be carried out, specifically:
	Claims 1 and 3 are so broad that a complete search was not possible for economical reasons. Only a few examples of novelty destroying documents have been cited in the search report.
	Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II	Observations where unity of invention is tacking (Continuation of item 2 of first sheet)
This Inter	mational Searching Authority found multiple inventions in this international application, as follows:
:	
1. 🔲 🛔	as all required additional search fees were timely paid by the applicant, this International Search Report covers all earchable claums.
2	us all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment f any additional fee.
3. 🗌 🛕	only some of the required additional search fees were umely paid by the applicant, this International Search Report overs only those claims for which fees were paid, specifically claims Nos.:
4. N	o required additional search fees were timely paid by the applicant. Consequently, this International Search Report is stricted to the invention first mentioned in the claims; it is covered by claims Nos.;
Romark en	The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.
